MASSAGING SYSTEM

2

3

ABSTRACT

4 A massage system providing a bracket for rigidly
5 holding an electric or percussion massager, for example, a
6 handheld massager, and a bracket height adjustment such
7 that the massager may be utilized by a user at a specific
8 height. The massage system provides rigid support for the
9 massager to enable a person to back into the massager
10 thereby more easily controlling the massage by him or
11 herself without requiring use of the hands. The unit is
12 wall mounted or door hung using a vertical bar and clamping
13 holder. A programmable, motor operated unit is also
14 disclosed.
